

Icesolation

Essence statement

Icesolation is a tactical survival game in which the player tries to guide a group of trapped researchers out of ice caves without direct visual feedback; with only the help of a rough map and radio messages.

Game overview

In Icesolation you control a group of researcher characters in an underground mine and cave system, which hosts numerous puzzles and problems for you to solve. The game difficulty increases the deeper the survivors descend.

There is very little visual feedback available about what's going on, as you cannot see what the survivors see. Instead you must rely on an echo-scan of the levels and voice-acted radio reports from the characters to guide the survivors. Personalities of the characters as well as their mental and physical health affect their actions and reactions.

The game has a heavy focus on captivating and atmospheric content including sounds, music, voice acting and lore, which will open up little by little as the survivors head deeper into the caves.
